## UNIT 6: BOTTOM-UP PARSING TECHNIQUES

There are two terminal networks (A and B) connected by a half-duplex C transmission channel (transmitted in both directions, but not at the same time). It also has a network analyzer that reads the messages that circulate through the channel

When one terminal of a network wants to establish a communication with a terminal of the other network, four messages are exchanged through channel C described by the following protocol:

From the home network a Setup message is sent to the destination network indicating that it wants to establish a communication with a specific machine of that network. The destination network must respond with a SetupAck message as acknowledgment of the received Setup message. Once the destination network terminal accepts the call request, it must send a Connect message to the terminal of the source network. The source network must respond with a ConnectAck as an acknowledgment of the received Connect message.

Each message consists of a series of Information Elements (EI). Each EI, in turn, consists of two fields. The first field always has a size of 1 byte and its value corresponds to the identifier of that EI. The second field will be the EI argument and its size depends on the EI.

## uc3m <br> Universidad Carlos III de Madrid

The messages with the EIs of which they are composed are described below. These EI must appear in the order shown in the following table. The EI of a message may be mandatory or optional. Mandatory EI must always be included in the message. The optional EIs may or may not appear.

| MESSAGE | Information <br> Elements | Mandatory <br> Optional |
| :---: | :--- | :--- |
|  | EISetup | Mandatory |
|  | EIAddress | Mandatory |
|  | EIOrigin | Optional |
|  | EIDestination | Mandatory |
| SetupAck | EISetupAck | Mandatory |
|  | EIDirection | Mandatory |
| Connect | EIConnect | Mandatory |
|  | EIDirection | Mandatory |
| ConnectAck | EIConnectAck | Mandatory |
|  | EIDirection | Mandatory |

The following table describes the defined EI with the description of the fields of which it is composed. For each field its size in bytes and its value are indicated. The first field always has a fixed value since it is the identifier of the EI and the second field has a variable value that corresponds to the argument of described EI:

|  |  | FIELDS |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Field 1 (Identifier EI) |  |  | Campo 2 (Identifier EI) |  |  |
|  |  | Name | Size | Value | Name | Size | Value |
| EI | EISetup | IDSetup | 1 byte | 'A' | CREF | 1 byte | [A-Z,a-z,0-9] Any alphabetic or numeric character |
|  | EISetupAck | IDSetupAck | 1 byte | 'B' | CREF | 1 byte | Same that Setup |
|  | EIConnect | IDConnect | 1 byte | 'C' | CREF | 1 byte | Same that SetupAck |
|  | EIConnectAck | IDConnectAck | 1 byte | 'D' | CREF | 1 byte | Same that Connect |
|  | EIDirection | IDDirection | 1 byte | 'E' | Direction | 1 byte | $\begin{aligned} & \mathrm{A} \rightarrow \mathrm{~B}={ }^{\prime} 0 \\ & \mathrm{~B} \rightarrow \mathrm{~A}={ }^{\prime} 1 \end{aligned}$ |
|  | EIOrigin | IDOrigin | 1 byte | 'F' | Origin | 3 bytes | $[0-9]^{3}$. Three digits |
|  | EIDestination | IDDestination | 1 byte | 'G' | Destination | 3 bytes | [0-9] ${ }^{3}$. Three digits |

Since messages of several different communications can be circulated through the same channel, it is possible that a message of another communication appears between the four messages corresponding to the same communication. In order to identify the communication to which a message belongs, the CREF field of EISetup, EISetupAck, EIConnect and EIConnectAck is used. Therefore, the four messages of which a communication is composed must contain the same value in their CREF argument of said Information Elements.

On the other hand, the EI EIDirection indicates whether the message has been transmitted in the $\mathrm{A} \rightarrow \mathrm{B}$ or $\mathrm{B} \rightarrow \mathrm{A}$ direction. Its possible values are ' 0 ' or ' 1 ' respectively.

EIOrigin and EIDestination contain in their argument the address of the origin and destination terminals respectively.

## uc3m Universidad Carlos III de Madrid

## Example:

Imagine that a Setup is sent from A to B, but before receiving the SetupAck from B, a Setup from $B$ to $A$ corresponding to another communication has been sent

The network analyzer would collect the following data:

It is required:

1. Describe formally the automaton that the network analyzer uses as a lexical analyzer, whose tokens are the Elements of Information (EI).
2. Define a grammar that generates messages that can be read on channel C. Is it LL(1)?. Otherwise, make the necessary modifications to make it.
3. Can the grammar of the second exercise be used to perform an $\operatorname{LR}(1)$ analysis? If not, modify it to make it so. Generate the first 8 states of the LR(1) analyzer for that grammar.

## uc3m

## Solution

For the implementation of the lexical analysis, we are going to use a non-deterministic finite automaton as the one shown below:

The formal description is;

$$
\begin{gathered}
N F A=\left(\sum_{T},\left\{\mathrm{q}_{0} . . \mathrm{q}_{18}\right\}, \mathrm{q}_{0}, f, F\right) \\
\sum_{T}=\{\mathrm{A}-\mathrm{Z}, \mathrm{a}-\mathrm{z}, 0-9\} \\
F=\left\{\mathrm{q}_{8}, \mathrm{q}_{9}, \mathrm{q}_{10}, \mathrm{q}_{11}, \mathrm{q}_{12}, \mathrm{q}_{15}, \mathrm{q}_{18}\right\}
\end{gathered}
$$

$f\left(\mathrm{q}_{0}, \mathrm{~A}\right)=\mathrm{q}_{1}$
$f\left(\mathrm{q}_{0}, \mathrm{~B}\right)=\mathrm{q}_{2}$
$f\left(\mathrm{q}_{0}, \mathrm{C}\right)=\mathrm{q}_{3}$
$f\left(\mathrm{q}_{0}, \mathrm{D}\right)=\mathrm{q}_{4}$
$f\left(\mathrm{q}_{0}, \mathrm{E}\right)=\mathrm{q}_{5}$
$f\left(\mathrm{q}_{0}, \mathrm{~F}\right)=\mathrm{q}_{6}$
$f\left(\mathrm{q}_{0}, \mathrm{~F}\right)=\mathrm{q}_{7}$
$f\left(\mathrm{q}_{1},\{\mathrm{~A}-\mathrm{Z}, \mathrm{a}-\mathrm{z}, 0-9\}\right)=\mathrm{q}_{8}$
$f\left(\mathrm{q}_{3},\{\mathrm{~A}-\mathrm{Z}, \mathrm{a}-\mathrm{z}, 0-9\}\right)=\mathrm{q}_{10}$
$f\left(\mathrm{q}_{4},\{\mathrm{~A}-\mathrm{Z}, \mathrm{a}-\mathrm{z}, 0-9\}\right)=\mathrm{q}_{11}$
$f\left(\mathrm{q}_{5},\{01\}\right)=\mathrm{q}_{12}$
$f\left(\mathrm{q}_{6},\{0-9\}\right)=\mathrm{q}_{13}$
$f\left(\mathrm{q}_{7},\{0-9\}\right)=\mathrm{q}_{16}$
$f\left(\mathrm{q}_{8}, \lambda\right)=\mathrm{q}_{0}$
$f\left(\mathrm{q}_{9}, \lambda\right)=\mathrm{q}_{0}$
$f\left(\mathrm{q}_{10}, \lambda\right)=\mathrm{q}_{0}$
$f\left(\mathrm{q}_{11}, \lambda\right)=\mathrm{q}_{0}$
$f\left(\mathrm{q}_{12}, \lambda\right)=\mathrm{q}_{0}$
$f\left(\mathrm{q}_{13},\{0-9\}\right)=\mathrm{q}_{14}$
$f\left(\mathrm{q}_{14},\{0-9\}\right)=\mathrm{q}_{15}$
$f\left(\mathrm{q}_{15}, \lambda\right)=\mathrm{q}_{0}$
$f\left(\mathrm{q}_{16},\{0-9\}\right)=\mathrm{q}_{17}$
$f\left(\mathrm{q}_{17},\{0-9\}\right)=\mathrm{q}_{18}$
$f\left(\mathrm{q}_{18}, \lambda\right)=\mathrm{q}_{0}$

When a token is read, it returns to the initial state $q 0$ to read the next one. In the table, $\mathrm{f}(\mathrm{qi},\{\mathrm{c} 1, \ldots, \mathrm{cn}\})=$ qj means that the transition is made with any of the characters that appear between braces.

The final states generate the following tokens:

## uc3m

| sTATE | Token |
| :---: | :--- |
| $\mathrm{q}_{8}$ | (EIsetup, A) |
| $\mathrm{q}_{9}$ | (EIsetupack, B) |
| $\mathrm{q}_{10}$ | (EIconnect, C) |
| $\mathrm{q}_{11}$ | (EIconnectack, D) |
| $\mathrm{q}_{12}$ | (EIDirection, [01]) |
| $\mathrm{q}_{15}$ | (EIOrigin, [0-9] ${ }^{3}$ ) |
| $\mathrm{q}_{18}$ | (EIDestination, $[0-9]^{3}$ ) |

A posible grammar is:

```
1 S ::= M S
2 ::=\lambda
3M ::= eisetup EIDirection O EIDestination
4 ::= eisetupack EIDirection
5 ::= eiconnect EIDirection
6 ::= eiconnectack EIDirection
O :: EIOrigin
8 ::=\lambda
```

To create the LL(1) analyzer, we start with the FIRST and FOLLOW set:

| $\Sigma_{N}$ | FIRST | FOLLOW |
| :--- | :--- | :--- |
| S | eisetup, eisetupack, eiconnect, eiconnectack, $\lambda$ | $\$$ |
| M | eisetup, eisetupack, eiconnect, eiconnectack | eisetup, eisetupack, eiconnect, eiconnectack, $\$$ |
| O | EIOrigin, $\lambda$ | EIDestination |

The LL table is:

| $\sum_{T}$ | S | M | O |
| :--- | :---: | :---: | :---: |
| eisetup | 1 | 3 |  |
| eisetupack | 1 | 4 |  |
| eiconnect | 1 | 5 |  |
| eiconnectack | 1 | 6 |  |
| EIDirection |  |  |  |
| EIOrigin |  |  | 7 |
| EIDestination |  |  | 8 |
| $\$$ | 2 |  |  |

This table is LL(1).

To know if it is $\operatorname{LR}(1)$ it is necessary to generate the table $\operatorname{LR}(1)$ and check that there is no problem. The first eight states generated from the grammar of the previous exercise will be.
