# Chemical Bonding (II)

# General Chemistry

## Contents

### 1. Basic Concepts.

- a) Molecular parameters
- b) Lewis Dot Symbols

### 2. The Covalent Bond

- a) Polar Covalent Bond
- b) Formal Charge
- c) Exceptions to the octet rule

### 3. The Valence-Shell Electron-Pair Repulsion Models

### 4. Bond theories

- a) Valence Bond Theory. Hybridization of Atomic Orbitals
- b) Molecular Orbital Theory

### 5. The Metallic Bond.

# General Chemistry

## 1. BASIC CONCEPTS

### A) Molecular Parameters

#### Bond Distance

- Average distance between the nuclei of two bonded atoms.
- Factors affecting bond length:
  - a) Size of the bonded atoms ( $\text{HI} > \text{HBr} > \text{HCl} > \text{HF}$ )
  - b) Multiplicity of bond ( $\text{C-C} > \text{C=C}$ )

Image from:  
[http://wikimediafoundation.org/wiki/File:Water\\_molecule\\_dimensions.svg](http://wikimediafoundation.org/wiki/File:Water_molecule_dimensions.svg)

#### Bond Angle

- The internal angle between the orbitals containing electron pairs in the valence shell of the central atom in a molecule.

#### Bond Enthalpy

- It is the energy required to break one mole of bonds of a particular type of substance in gaseous state.

# General Chemistry

## 1. BASIC CONCEPTS

### B) Lewis dot symbols

- Valence  $e^-$  play a fundamental role in chemical bonding  $\rightarrow$  *the octet rule*
- *Chemical bond in terms of Lewis dot symbols*
  - **ionic bond**  $\rightarrow$   $e^-$  transfer
  - **covalent bonds**  $\rightarrow$   $e^-$  sharing

# General Chemistry

## 2. THE COVALENT BOND

In covalent bond atoms share electrons to complete their valence shell (i.e. to reach the gas noble configuration)

It forms between no-metallic elements.

### Coordinate covalent Bonds

The electron pair is provided by one of the atoms that form the covalent bond.

# General Chemistry

## Polar Covalent Bonds

### Electronegativity:

describes the ability of an atom (or, more rarely, a functional group) to attract electrons (or electron density) towards itself in a covalent bond.

### Dipole moment

$$\mu = Q \times r$$

$r$  = distance between atoms

$Q$  = charge

Units Debye, D

$$1 \text{ D} = 3.33 \times 10^{-30} \text{ C}\cdot\text{m}$$

a) Non polar molecules

b) Polar molecules

- Centre of positive charge
- Centre of negative charge
- Atomic nucleus

*There is a shift of the electron density from H to F*

# General Chemistry

## Polarity of molecules

### Diatomic molecules

Homonuclear molecules:  $\text{H}_2$ ,  $\text{O}_2$  y  $\text{F}_2$

Heteronuclear molecules  $\text{HCl}$ ,  $\text{CO}$  y  $\text{NO}$

### Polyatomic Molecules

Polarity depends on:

- Polarity of the chemical bonds
- Geometry

$\text{CCl}_4$   
A non-polar molecule

$\text{CHCl}_3$   
A polar molecule

$\mu$  is the vectorial sum of the dipolar moments of the chemical bonds of the molecule.

# General Chemistry

## Formal Charge

$$\text{formal charge on an atom in a Lewis structure} = \text{total number of valence electrons in the free atom} - \left[ \text{total number of nonbonding electrons} + \frac{1}{2} \left( \text{total number of bonding electrons} \right) \right]$$

The sum of the formal charges of the atoms in a molecule or ion must equal the charge on the molecule or ion.

### Practice Exercise.

Write the Lewis structure for formaldehyde ( $\text{CH}_2\text{O}$ ) using the concept of formal charge. Then compare your prediction with the real structure.

# General Chemistry

## Exceptions to the Octet Rule

- Odd  $e^-$  species.

- Incomplete octets.

- Expanded octets.

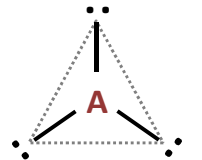

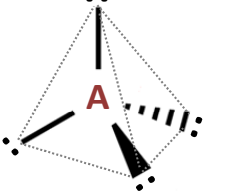

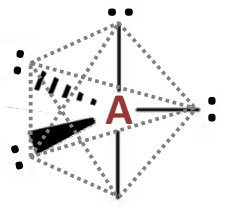

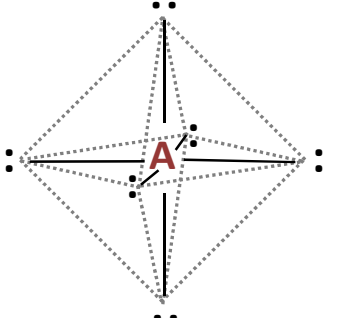

# General Chemistry

## 3. VSEPR MODEL

Electron pairs repel each other whether they are in chemical bonds (bond pairs) or unshared (lone pairs). Electron pairs assume orientations about an atom to minimize repulsions.

### A) Molecules with no lone pairs on the central atom

No. of electron pairs or charge clouds		Distribution of the charge clouds (Molecular Shape)
2	BeCl <sub>2</sub>	 <b>Linear</b>
3	BF <sub>3</sub>	 <b>Trigonal planar</b>
4	CH <sub>4</sub>	 <b>Tetrahedral</b>
5	PCl <sub>5</sub>	 <b>Trigonal bipyramidal</b>
6	SF <sub>6</sub>	 <b>Octahedral</b>

# General Chemistry

## 3. VSEPR MODEL

### B) Molecules with lone pairs on the central atom

bond pairs vs.  
Bond pairs

lone pairs  
vs. bond pairs

Lone pairs vs.  
Lone pairs

# General Chemistry

## 3. VSEPR MODEL

### B) Molecules with lone pairs on the central atom

Number of bond pairs ("x")	Number of Lone pairs of electrons("y")	Number of group of electrons (n = x+y)	VSEPR Notation (AB <sub>x</sub> E <sub>y</sub> )	Electron group geometry	Example	Ideal bond angles	Molecular geometry
2	0	2	AB <sub>2</sub>	Linear	BeCl <sub>2</sub>	180°	Linear
2	1	3	AB <sub>2</sub> E <sub>1</sub>	Trigonal planar	SO <sub>2</sub>	120°	Angular
4	0	4	AB <sub>4</sub>	Tetrahedral	CH <sub>4</sub>	109.5°	Tetrahedral
3	1		AB <sub>3</sub> E <sub>1</sub>		NH <sub>3</sub>		Piramidal
2	2		AB <sub>2</sub> E <sub>2</sub>		H <sub>2</sub> O		Angular
5	0	5	AB <sub>5</sub>	Trigonal Bipyramidal	PCl <sub>5</sub>	90°; 120°	Trigonal pyramidal
4	1		AB <sub>4</sub> E <sub>1</sub>		SF <sub>4</sub>		Seesaw
3	2		AB <sub>3</sub> E <sub>2</sub>		ClF <sub>3</sub>		T-shaped
2	3		AB <sub>2</sub> E <sub>3</sub>		XeF <sub>2</sub>		Linear
6	0	6	AB <sub>6</sub>	Octahedral	SF <sub>6</sub>	90°	Octahedral
5	1		AB <sub>5</sub> E <sub>1</sub>		ICl <sub>5</sub> , BrF <sub>5</sub> XeOF <sub>4</sub>		Square pyramidal
4	2		AB <sub>4</sub> E <sub>2</sub>		XeF <sub>4</sub> ; ICl <sub>4</sub> <sup>-</sup>		Square planar

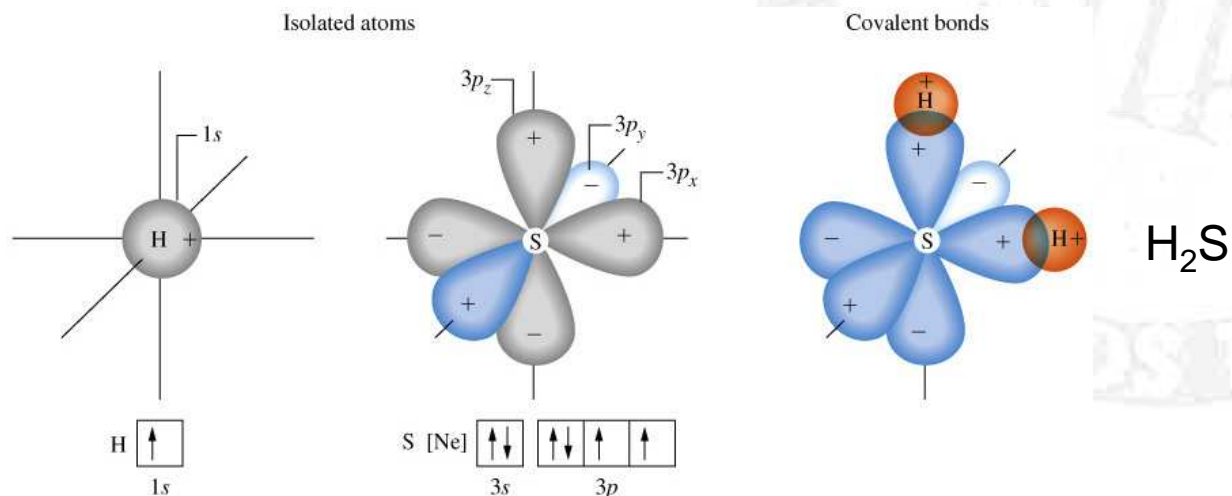

# General Chemistry

## 4. BOND THEORIES

### Valence Bond Theory

- Atomic orbital overlap describes covalent bonding.
- Area of overlap of orbitals is *in phase*.
- A *localized* model of bonding.

General Chemistry: Principles and Modern Applications (R.H. Petrucci)

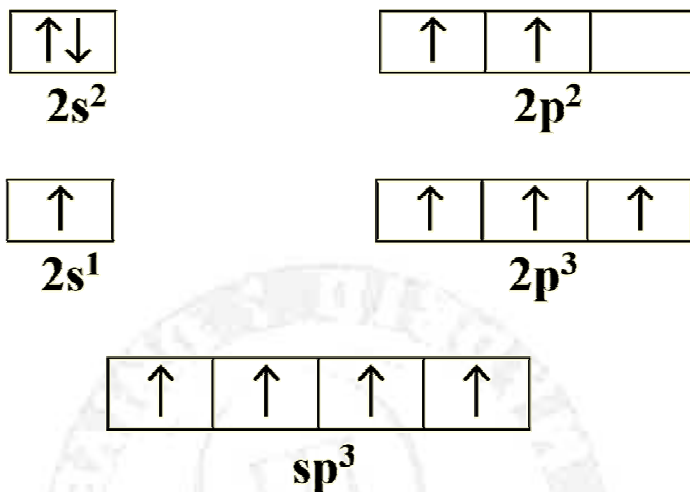

# General Chemistry

## 4. BOND THEORIES

### Valence Bond Theory

### Hybridization of Atomic Orbitals

CH<sub>4</sub>

**Hybridization:** term applied to the mixing of atomic orbitals in a atom (i.e. linear combination of the wavefunctions).

- Promotion
- Hybridization

CH<sub>4</sub> molecule

**4  $\sigma$  bonds: C(sp<sup>3</sup>)-H(1s)**

**Bond angle: 109.5 °**

# General Chemistry

## 4. BOND THEORIES

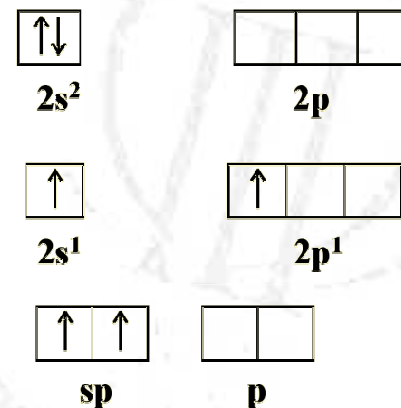

### Valence Bond Theory

Mixing of orbitals ( $3s, 3p$  &  $3d$ )  
(Hybridization)

$sp^3d^2$  orbitals

$\text{SF}_6$  molecule

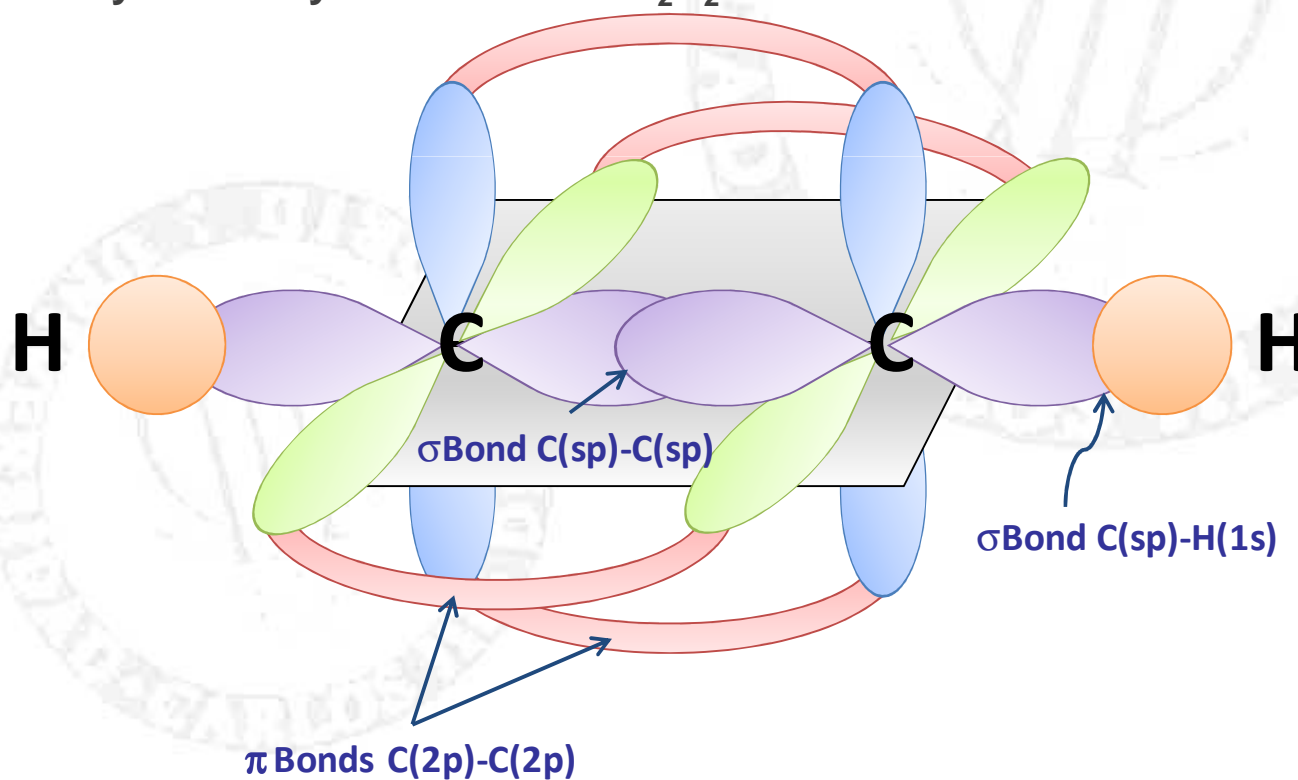

# General Chemistry

## 4. BOND THEORIES

### Valence Bond Theory

**Hybridization of Atomic Orbitals.  
Geometry of Organic Molecules.**

### B) Geometry in acetylene molecule $C_2H_2$

# General Chemistry

Hybridization	Ideal bond angles	Molecular geometry	Stick and balls Model
$sp$	$180^\circ$	Linear	
$sp^2$	$120^\circ$	Trigonal	
$sp^3$	$109.5^\circ$	Tetrahedral	
$sp^3d$	$90^\circ; 120^\circ$	Trigonal pyramidal	
$sp^3d^2$	$90^\circ$	Octahedral	

# General Chemistry

## 4. BOND THEORIES

### Molecular Orbital Theory

Explains the formation of the H-H bond in H<sub>2</sub> molecule.

*Description of the model:*

When the 1s wave functions of the **two hydrogen atoms (H)** are combined, one sigma ( $\sigma$ ) bonding orbital (named  $\sigma_{1s}$ ) is obtained. It is known as **linear combination of atomic orbitals (LCAO)**.

-The sum of the two 1s orbitals (one for each atom) yields the **bonding orbital**. In terms of wave mechanics, this corresponds to a **constructive interaction**.

-The difference of the two orbitals forms the **antibonding orbital**,  $s_{1s}^*$ , i.e. in terms of wave mechanics, this corresponds to a **destructive interference**.

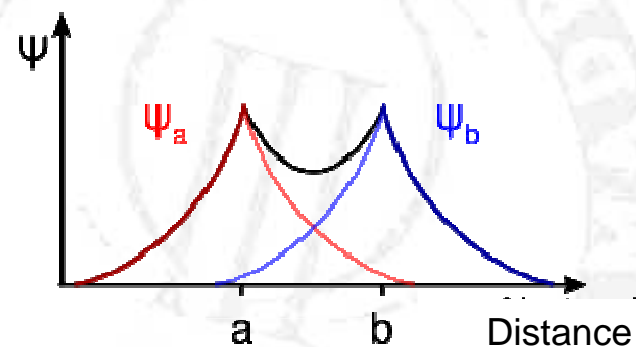

# General Chemistry

## 5. THE METALLIC BOND

- First approach to explain the metallic bond: the **electron sea model**
  - Nuclei are in a sea of electrons (the valence electrons)
  - It explains metallic luster and malleability

Force applied

# General Chemistry

## 5. THE METALLIC BOND

- Bond theories: **the Band theory**
  - It is an extension of the MO theory
  - "N" atoms give "N" orbitals with very close energies  $\rightarrow$  a **band** is formed.

### Band theory in alkaline metals

Outer shell electron configuration:  $ns^1$   
"N" orbitals, "N" levels  $\rightarrow$  N/2 filled levels

### Band theory in alkaline earths metals

Outer shell electron configuration:  $ns^2$   
"N" orbitals, "N" levels  $\rightarrow$  "N" filled levels  
"p" and "s" bands overlap in energy.

# General Chemistry

## 5. THE METALLIC BOND

### Elements of Group 14

	Tin	Germanium	Silicon	C (Diamond)
Gap (eV):	0,08	0,72	1,11	6,0
