Carlos III de Madrid

Objective

Objective

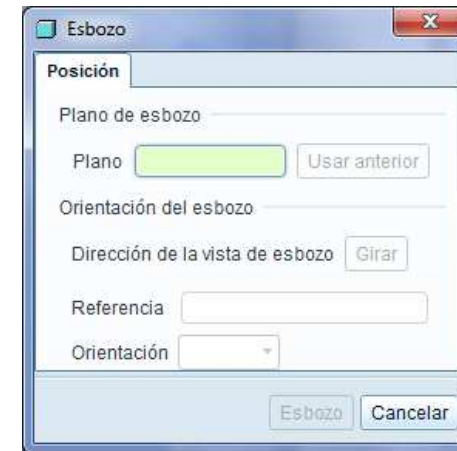

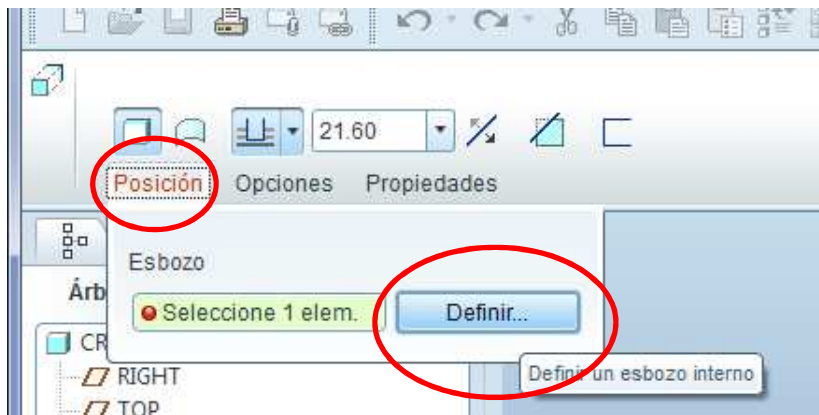

Early steps

- Before start working: Define working directory!!
- Go to <Fichero-Definir directorio de trabajo...>
- Introduce the most convenient path directory

Create an extrusion

- Press the extrusion button
- Go the "position" tab (Posición), and then press the "define" (definir) button, a small screen will pop-up.

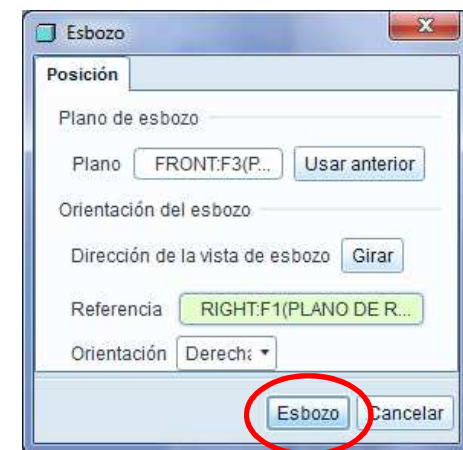

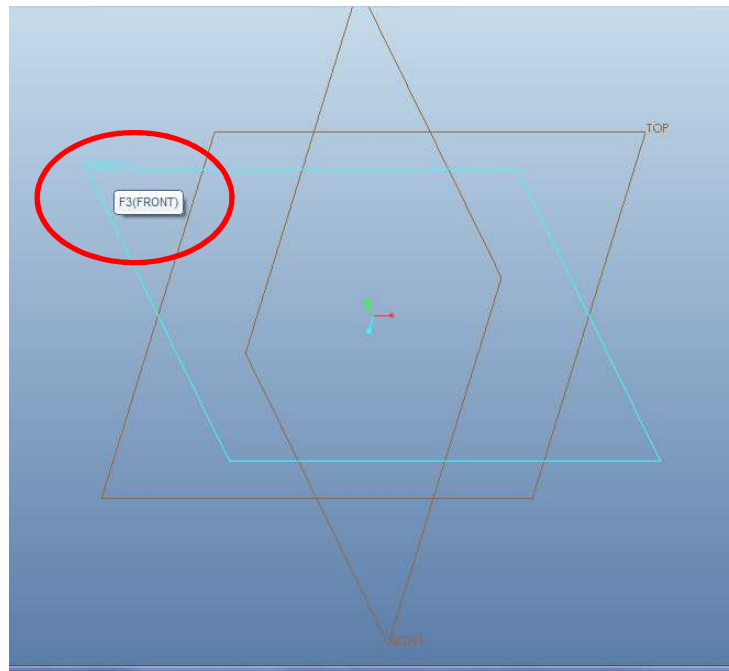

The small screen

Create a extrusion

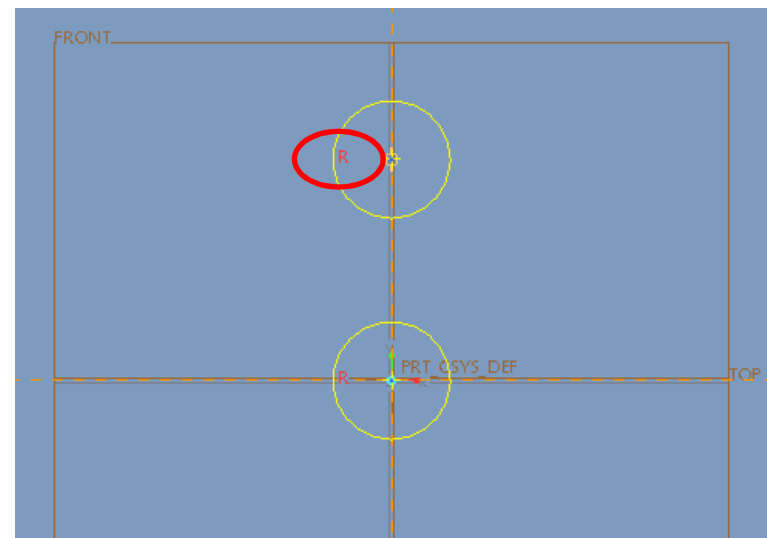

- Select the plane marked as "FRONT" and press "sketch"(Esbozo) button on the small screen. This will be the sketch plane (Plano de esbozo)

Make the sketch

- Draw a circle on the intersection of the planes (the cursor will automatically snap to it)
- Draw a second circle over the previous one, and adjust the size until a red R appears, this means that both circles have the same size.

Make the sketch

- Connect the two circles with lines
- Use the trim tool to remove internal line segments, and apply the dimensions until the sketch looks like in the figure.
- Press to finish.

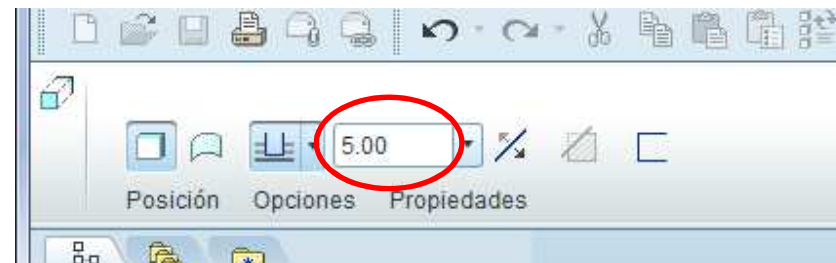

Remove these segments by clicking with the trim tool

Finish the extrusion

- On the text box introduce "5" to define the depth of the extrusion, and press to finish.

Make another extrusion

- Press the extrusion button, and select the front surface of the previous extrusion as the sketch plane.

Sketch plane

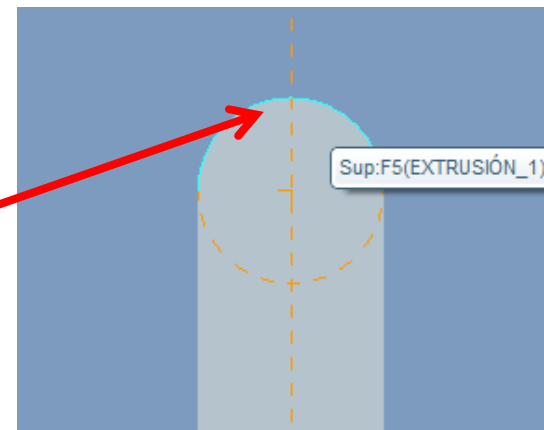

Make another extrusion

- In the menu select <Esbozo-referencias>

- Then click on the top of the part. A circle drawn with dashed lines will appear.

Click here to add this surface as reference

Make another extrusion

- Draw a circle that matches the one with dashed lines and press to finish the sketch.
- The depth of the extrusion is 3,5mm.

Add a hole

- Use the extrusion tool, and select the same sketch plane of the last operation.
- Press  to specify that material should be removed from this operation.
- Change the direction of the extrusion with .
- Finally, press  to make a pass-thru hole, and then press  to finish.

Add the pin

- Using the previous steps make an extrusion with 10mm diameter and 8mm depth. This will be the pin of our mechanism.

Add a chamfer

- Click on the chamfer tool and select the edge of the pin done in the previous step.
- Select the DxD option, and put 1 as D parameter.

Add the circlip groove

- Select the revolve tool, and press the Position(posición) tab and then the "define"(definir) button. Select the planes marked as "right" to sketch on.

Add the circlip groove

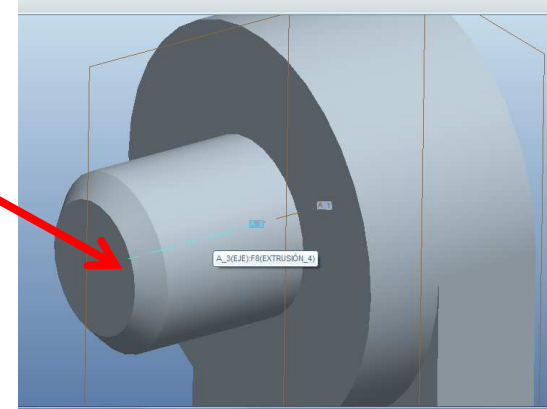

- Click on the sketch button, but before start to draw go to <esbozo-referencias> to add the following references:

Click here to add these surface as references

Add the circlip groove

- Draw a sketch as shown and click the button.
- Now click on the axis, and write 360 in the text box. Finally press the  button to remove material and press to finish.

Add a fillet

- Select the fillet tool, and select the edge of the figure.
- Type 10 in the text box and press to finish

Select this edge

The result
