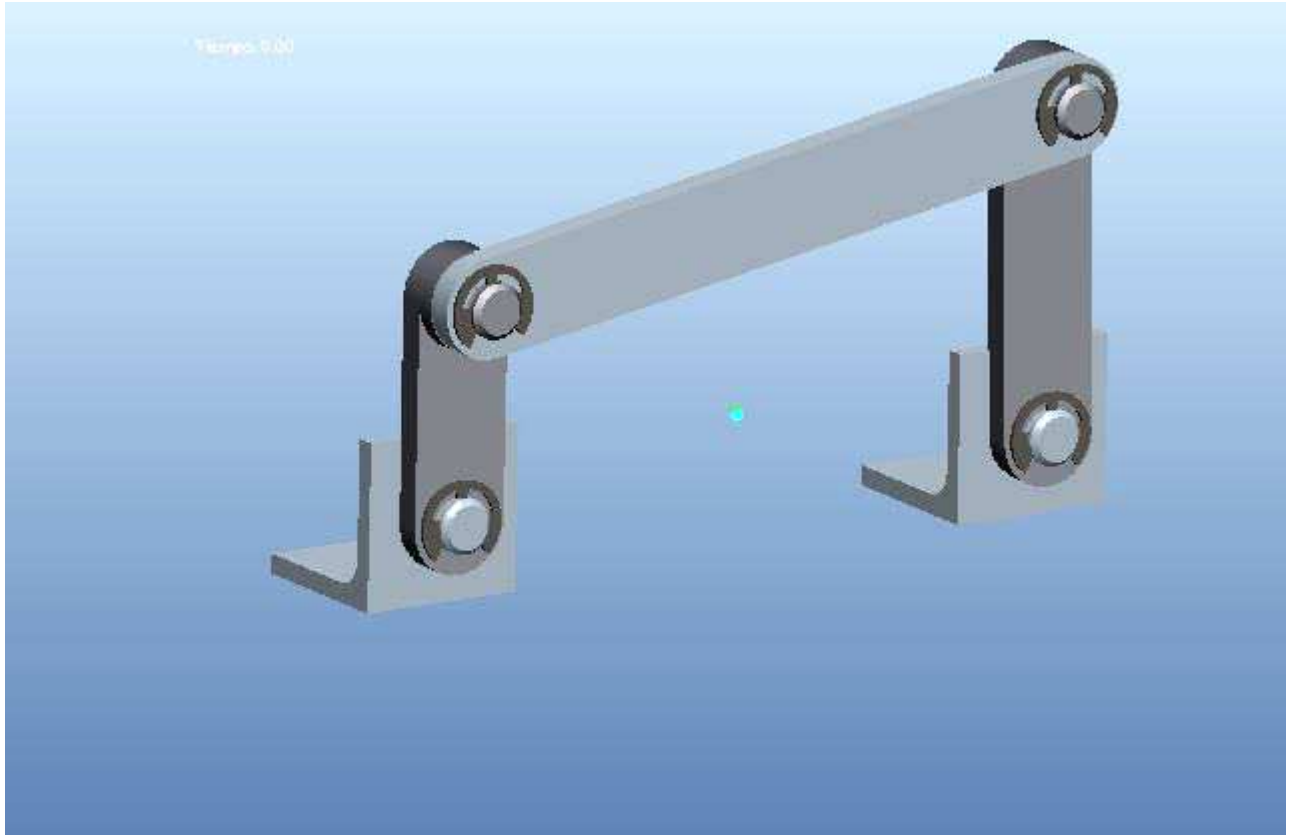
MACHINE THEORY
Bachelor in Mechanical Engineering

MECHANISMS SIMULATION

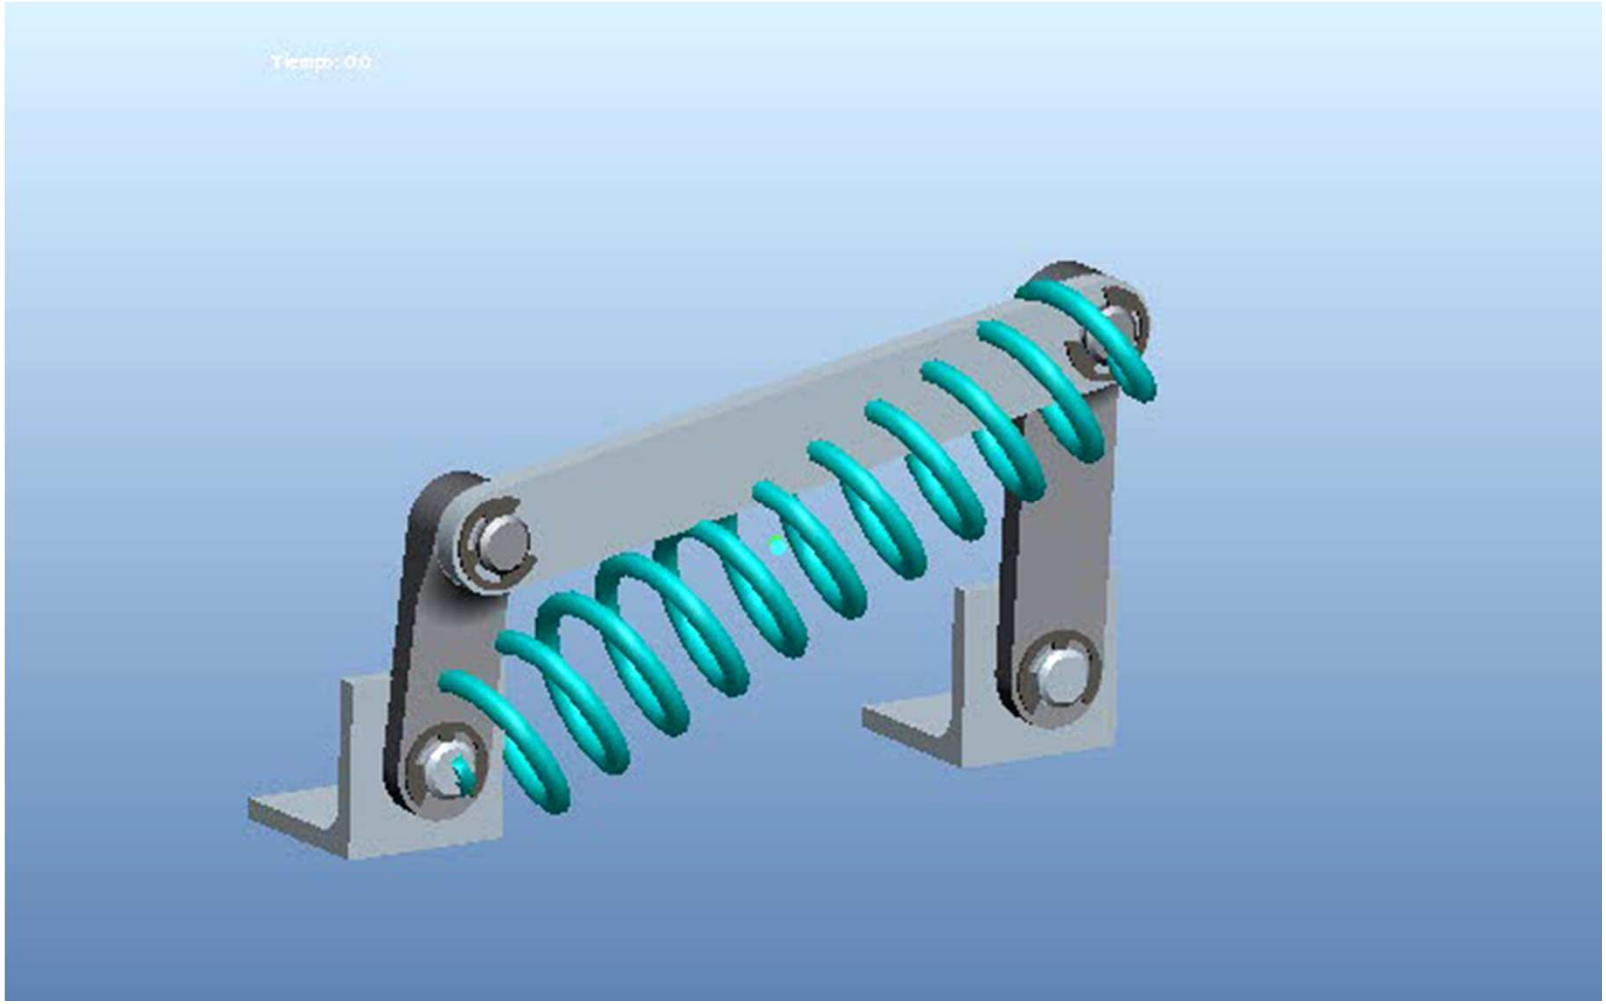
Mauricio Alba Lucero 2011

Universidad
Carlos III de Madrid

Objective

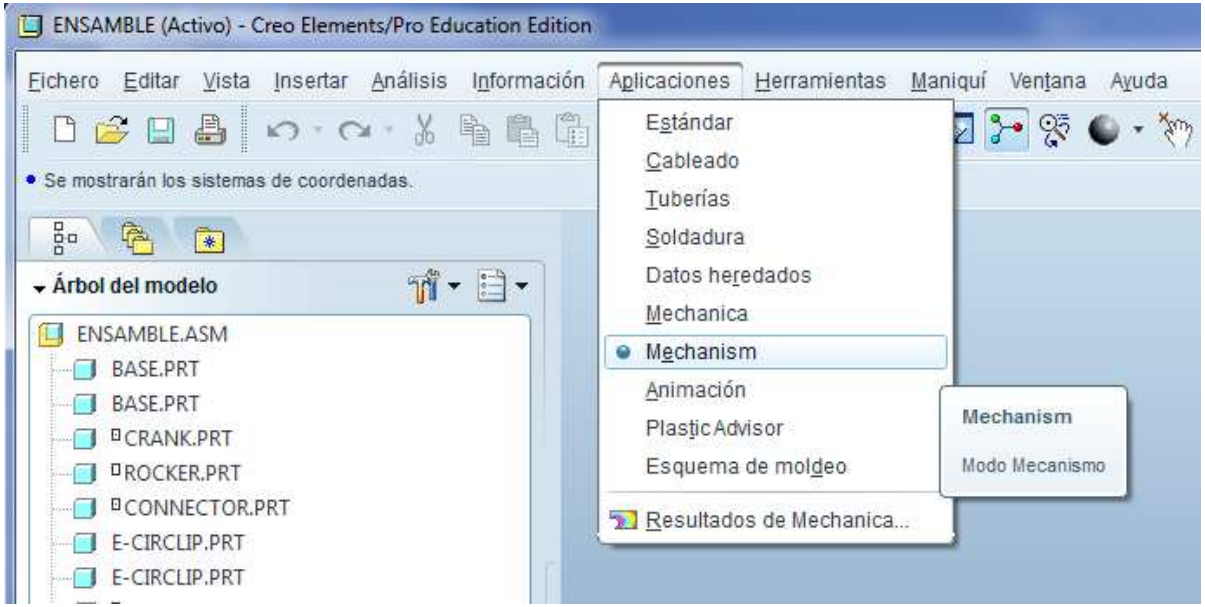


Objective



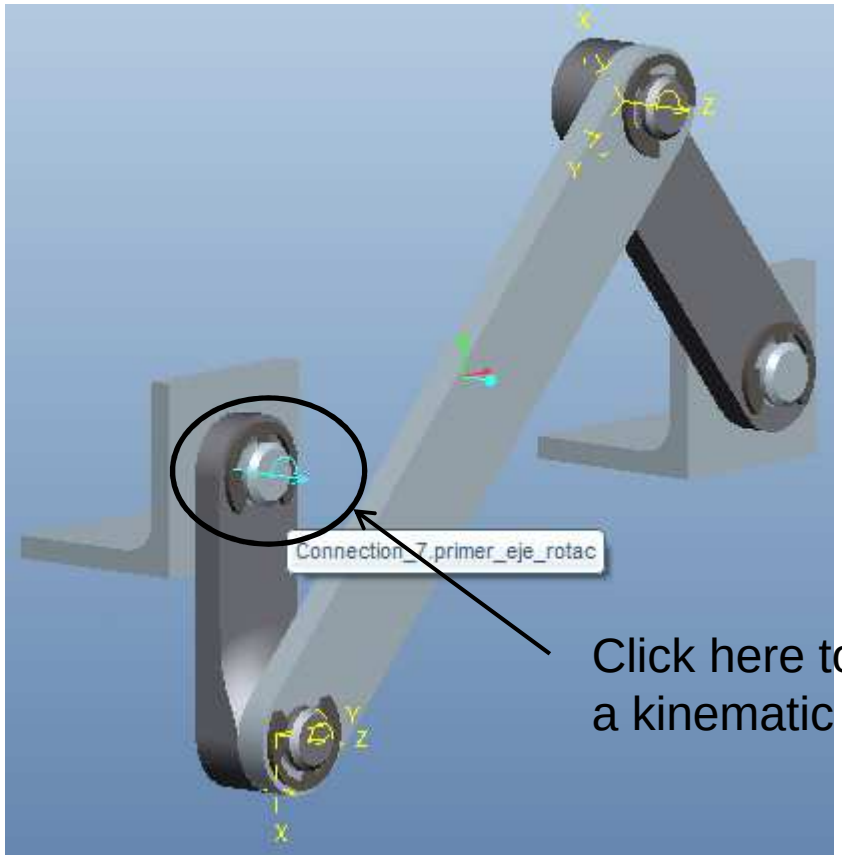
Early steps

- Download the parts from Aula Global
- Define working directory
- Open “ensamble.asm”
- Change to mechanism application



Universidad Carlos III de Madrid

Add a kinematic motor



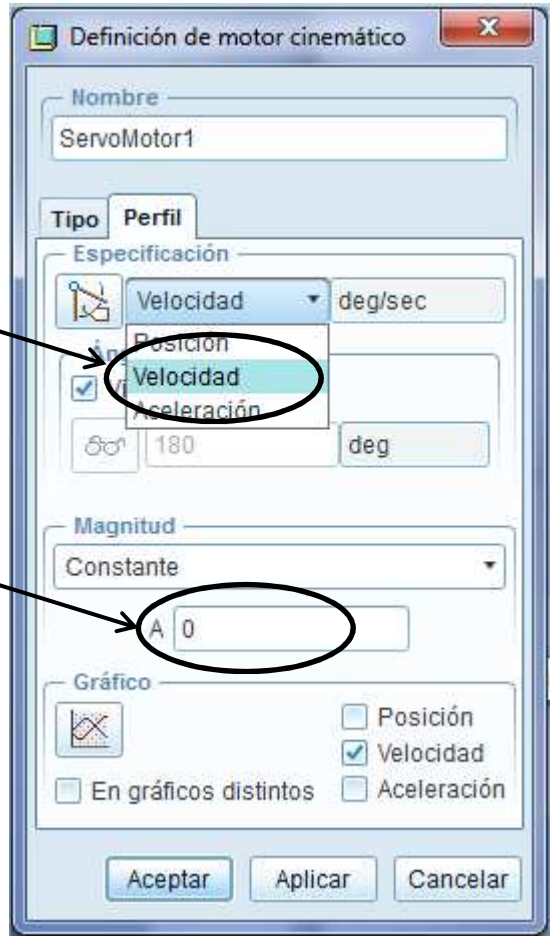
Click here to add
a kinematic motor

Click here to add
a kinematic motor

Define the type and parameters of the motor

Select the type of motor (Velocidad).

And define its magnitude as 40

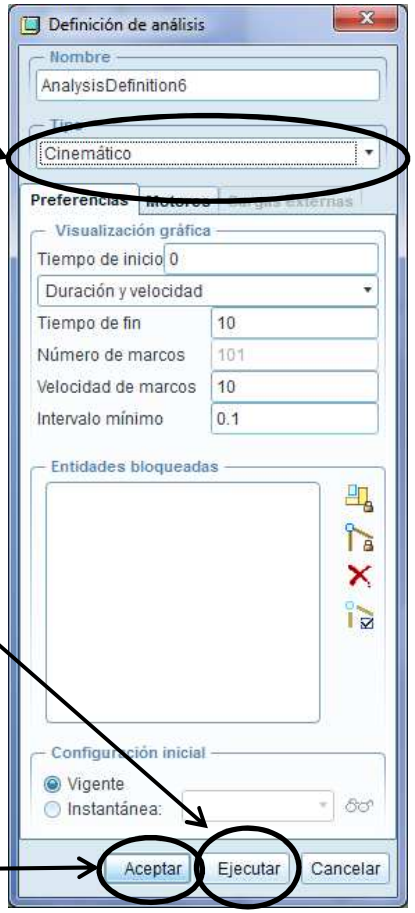


Universidad Carlos III de Madrid

Perform the simulation

Click here to start the simulation

First, define the anaylsis to kinematic



Then click on “Ejecutar”

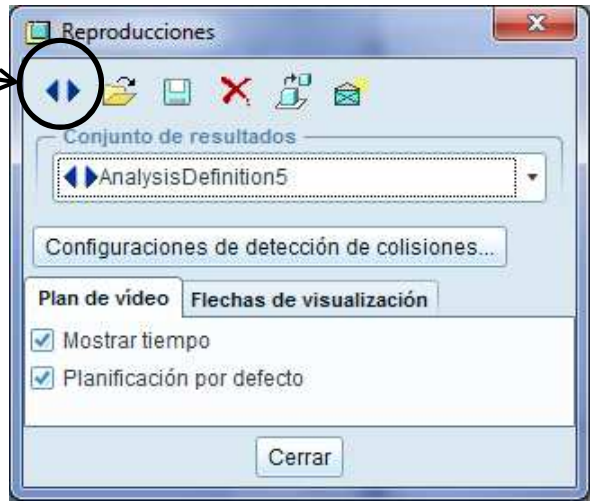
And finally “Aceptar”

Universidad Carlos III de Madrid

Visualize the results

To visualize the animation click here

And then click here

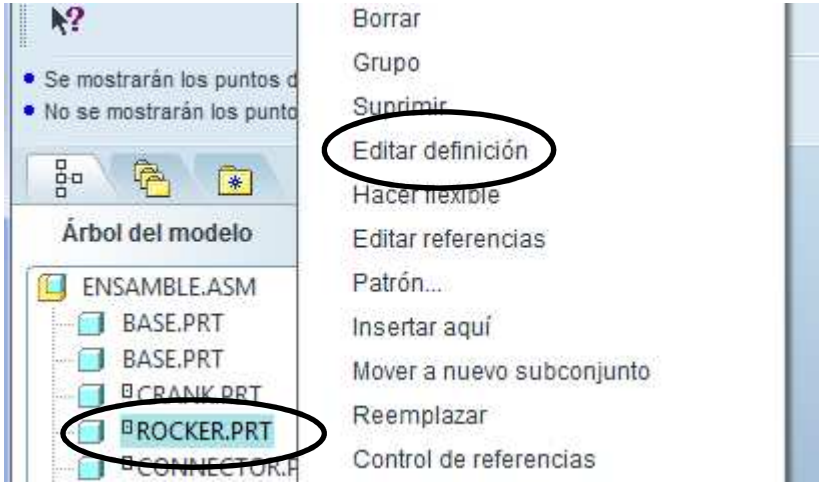


You can export the animation using this button.

Universidad Carlos III de Madrid

Prepare the model to be meassured

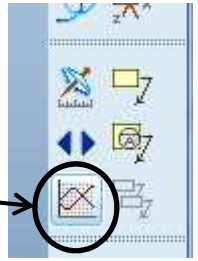
- In order to take measurements from the model, it is required that all the joints are defined as mechanism.
- Come back to the “Estándar” environment in the “Aplicaciones” menu.
- Edit the definition of the **rocker** and define all its connections as mechanism (This error was done on purpose).



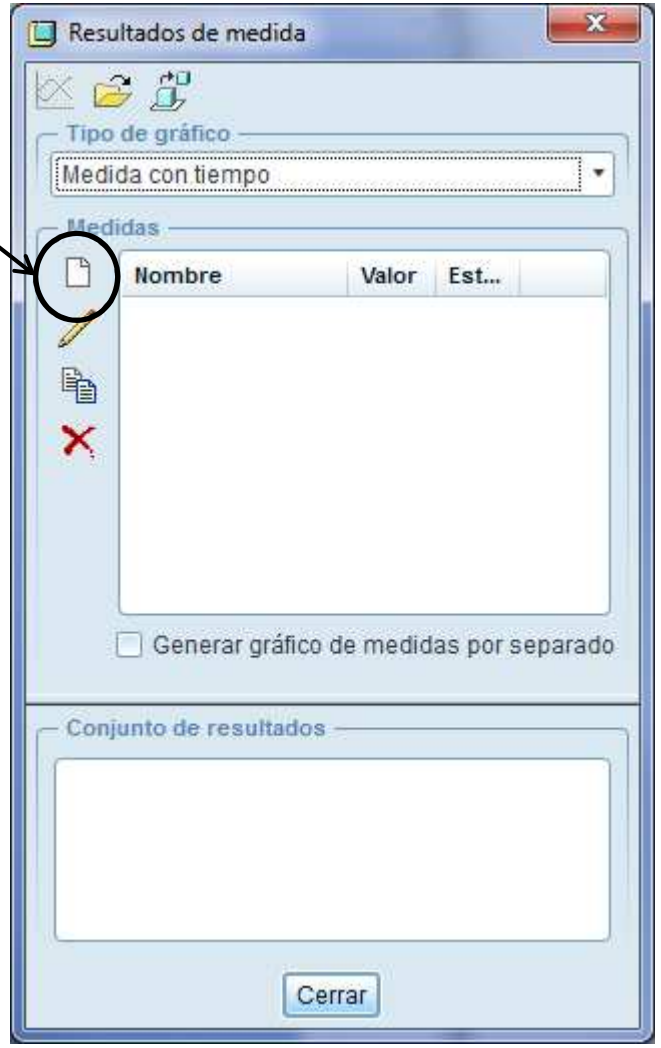
Universidad Carlos III de Madrid

Define the parameters to measure

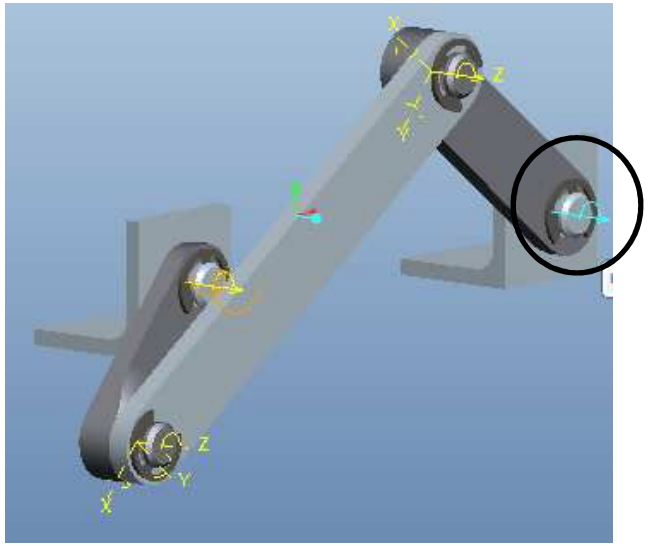
First, click here to define the measurements



Then, here to create the measurements



And finally, select this axis to create the measurement

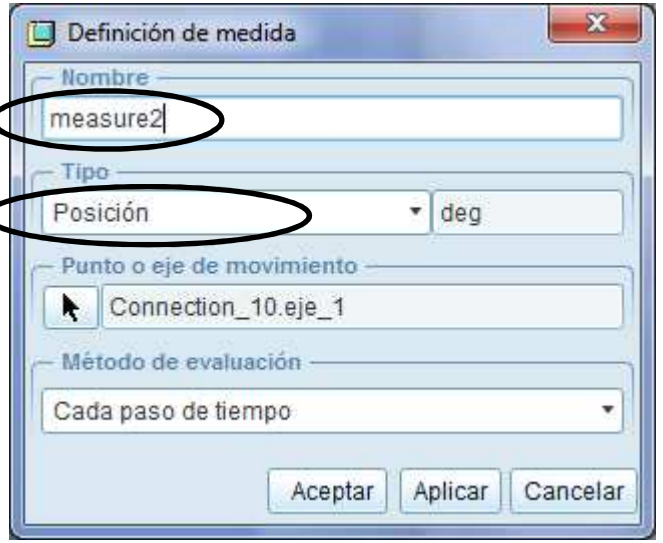


Define the parameters to measure

- Create 3 parameters by repeating the previous steps. The parameters are the position, velocity and acceleration.
- Run the simulation again by clicking on 

Define the right name to avoid confusions

And select the right type



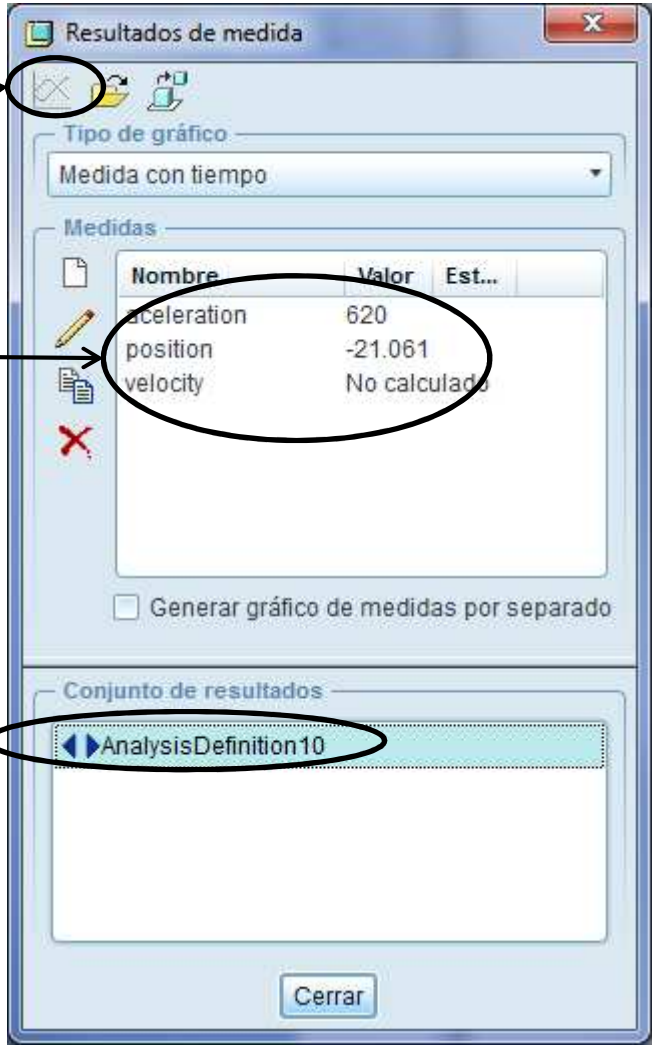
Universidad Carlos III de Madrid

Visualize the results

And finally click on this button.

Then, select the variable or variables you want to visualize

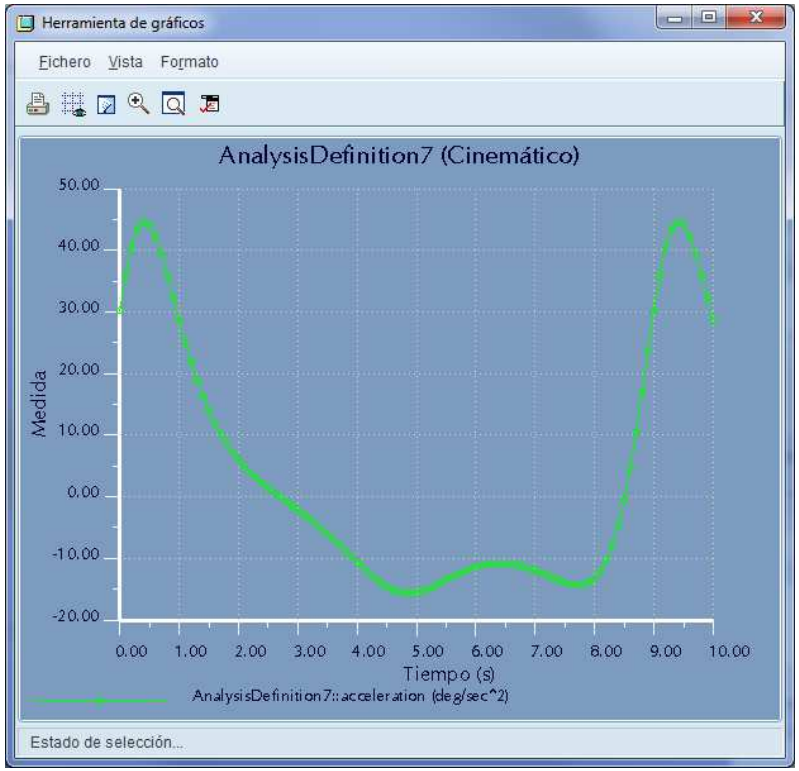
First, click on the analysis you want to see the results



Universidad Carlos III de Madrid

Visualize the results

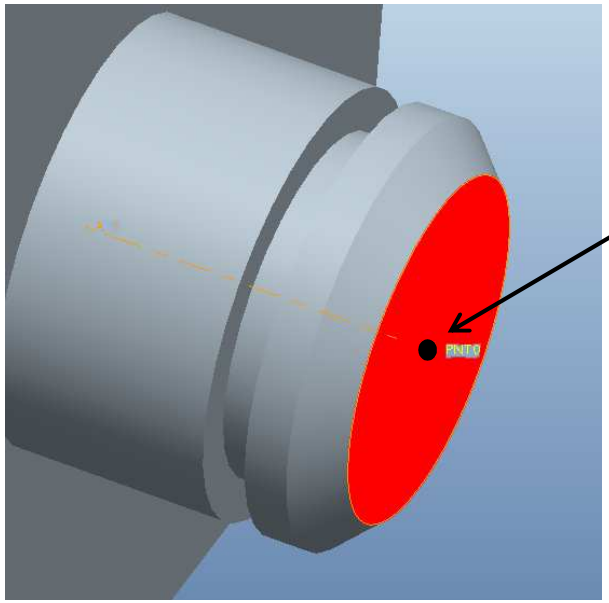
- You can export the results to excel or text format. Just play with the menus to discover the possibilities.



Universidad Carlos III de Madrid

Perform a dynamic analysis

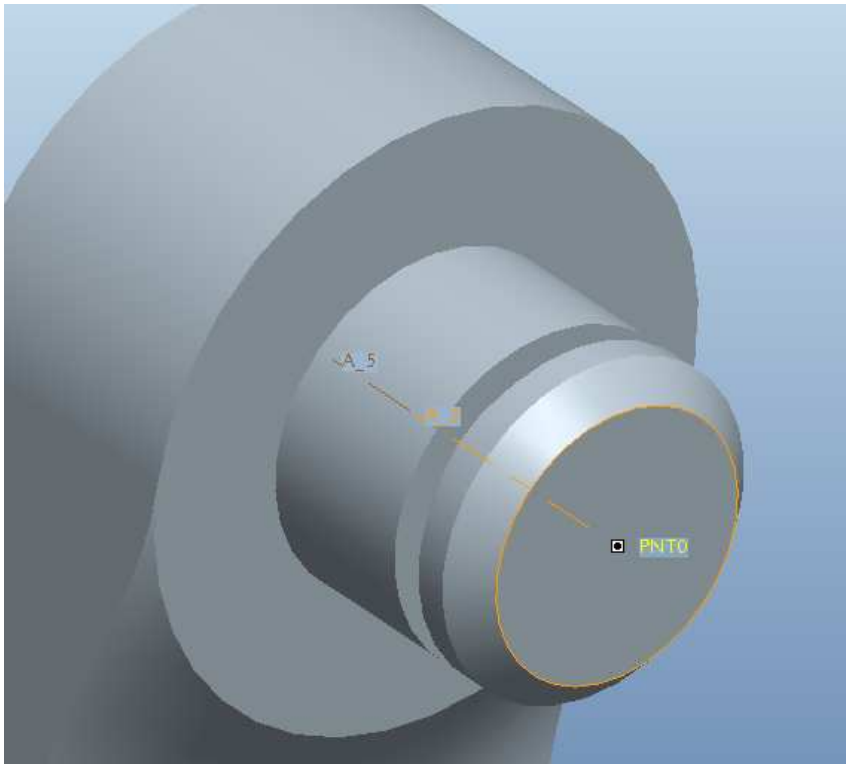
- Go to <file-save as> and save “assembly.asm” as “assem_dyn.asm”.
- Open base.prt and add a reference point by clicking over 
- When it is done, save and close this windows.



Use the intersection of the axis and the red face as references.
First click on the face, and then press control key and click on the axis.

Add more reference entities

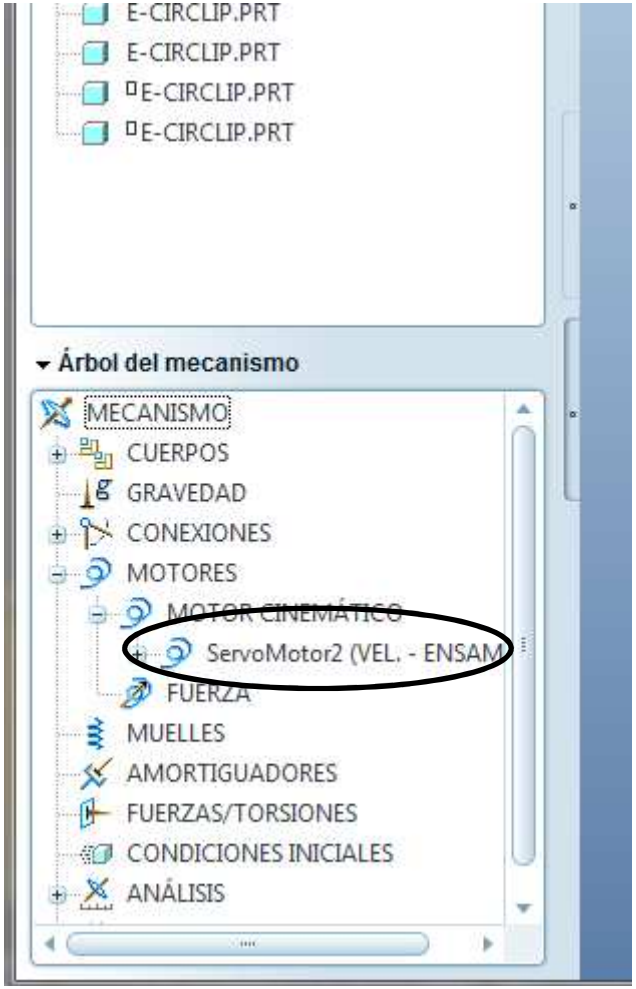
- Repeat the process for the part “rocker.prt”.



Universidad Carlos III de Madrid

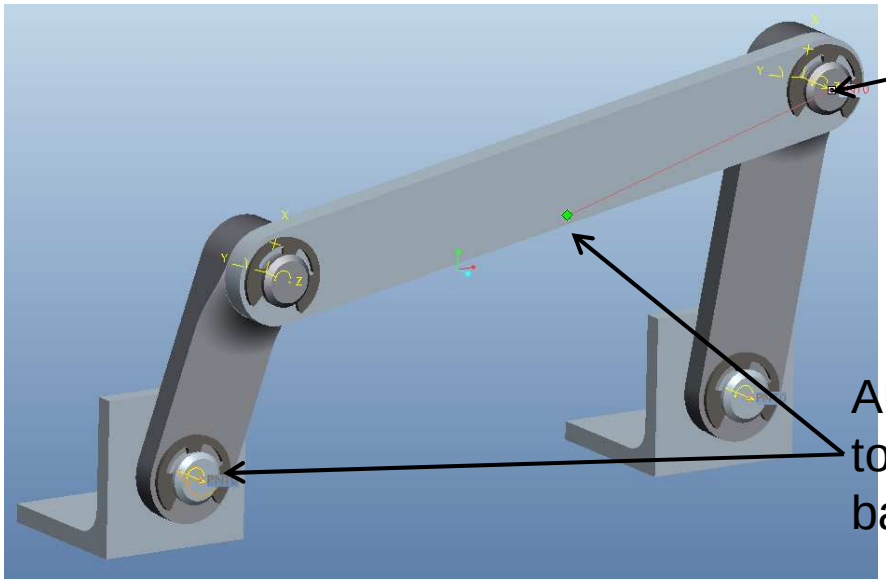
Add a spring

- Open asm_dyn.asm, go to the mechanism module and erase the kinematic motor by selecting it on the tree of the mechanism (Arbol del mecanismo) and then pressing delete button.



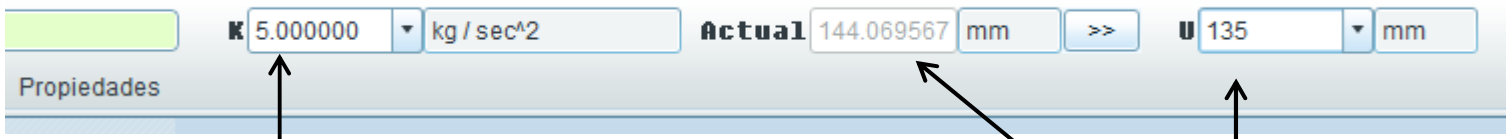
Universidad Carlos III de Madrid

Add a spring



First click on the reference point of the rocker.

And then drag the green dot to the reference point of the base.



Insert 5 as stiffness coefficient

Insert approximately 10mm less than the actual distance

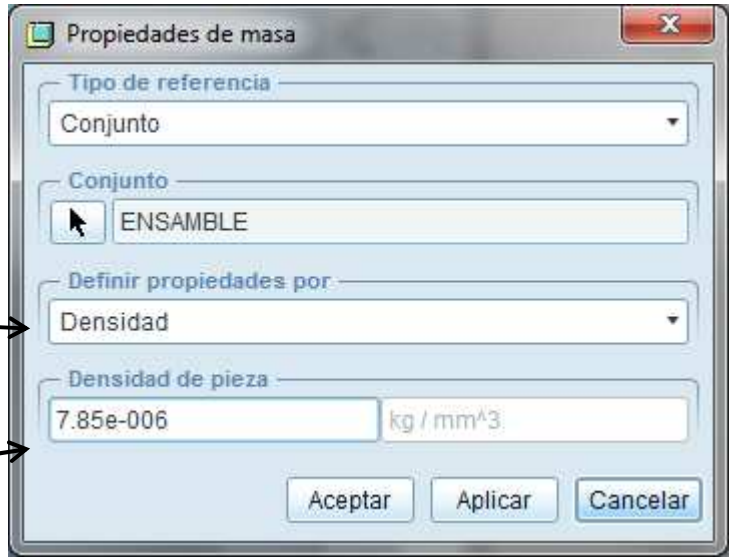
Universidad Carlos III de Madrid

Add mass properties

Select “Conjunto” as reference type

Then define the properties using “Densidad”

And insert 7.85e-6

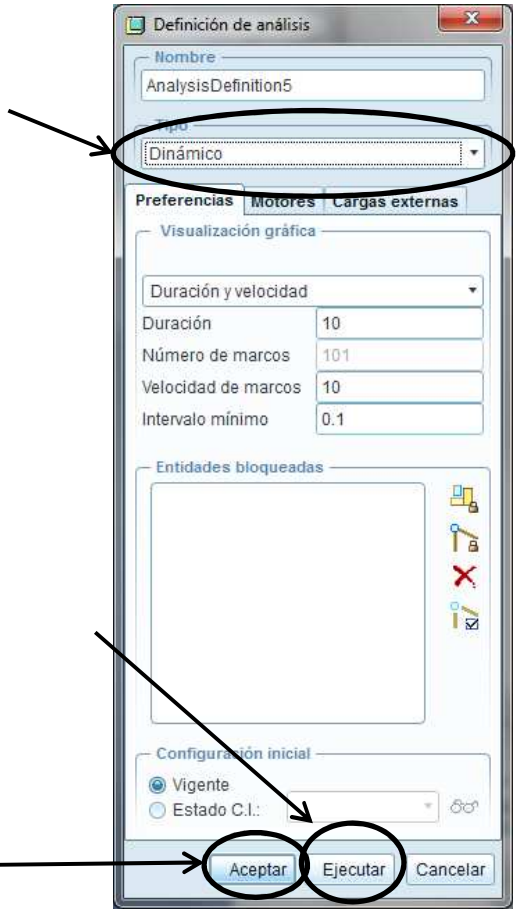


Universidad Carlos III de Madrid

Perform the simulation

Click here to start the simulation

This time select “Dinámico” as the type of analysis



Then click on “Ejecutar”

And finally “Aceptar”

Enjoy the result!
