Denial of Service (DoS) Detection

IT Security Group

Guillermo Suárez de Tangil
(guillermo.suarez.tangil@uc3m.es)

Remembering module 1...

- ▶ **Firewall configuration**
 - ▶ All users should have granted access to Fakebook
 - ▶ The machine should have granted access to security updates
 - ▶ Any other access should've not be granted
 - ▶ Remote access and PING should be logged
 - ▶ Remote connections only from a specific IP address
- ▶ **SSH**
 - ▶ Remote administration (SSH)
- ▶ **File-system Permissions**
 - ▶ New web administrator user

Today

- ▶ Denial of Service Attack
 - ▶ We will see how to detect a DoS...
- ▶ Snort
 - ▶ ... by means of **Snort**,
 - ▶ an Intrusion Detection System (IDS)

Denial of Service Detection

- ▶ Attempt to make a computer resource unavailable
- ▶ Prevent an internet site or service from functioning efficiently or at all, temporarily or indefinitely:
 - ▶ Web servers
 - ▶ Gateways such as credit card payments
 - ▶ Root name server
- ▶ **Techniques:**
 - ▶ Saturation
 - ▶ Malformed packets
- ▶ **Techniques:**
 - ▶ Http Flood, ICMP Flood, SYN Flood, etc.

Prevention and Response

- ▶ How to detect DoS?
 - ▶ Blocking malicious packets
 - ▶ *Ping of the dead*
 - ▶ Blocking saturation
 - ▶ Counting number of connections per second from the same source IP
- ▶ Yes! But what about...?
 - ▶ Low-rate Denial-of-Service attacks
 - ▶ Permanent denial-of-service attacks

Prevention and Response

- ▶ Effective prevention and response:
 - ▶ Firewalls
 - ▶ Deny some protocols
 - ▶ Switches and routers
 - ▶ Rate limiting capability
 - ▶ **Intrusion Detection and Prevention Systems**

Intrusion Detection Systems (IDS)*

- ▶ Network and computer intrusions presents behavioral patterns
- ▶ Intrusion Detections
 - ▶ Methods and techniques used to detect suspicious activities
 - ▶ Matching of data with a set of known rules
 - ▶ Generate alerts and logs suspicious activities
- ▶ Classification
 - ▶ Network IDS (NIDS)
 - ▶ Sniffs network traffic
 - ▶ Host IDS (HIDS)
 - ▶ Monitors computers

Intrusion Detection Systems (IDS)

- ▶ **Pattern**
 - ▶ Signatures revealing malicious activities
 - ▶ In network packets:
 - ▶ Patterns can be related to any of the attributes of the packet
- ▶ **Alerts**
 - ▶ Anomalous activity is notified to the user and/or admin
 - ▶ Stored in a log file or a data base
- ▶ **False Alert**
 - ▶ Generated by non-malicious activity
- ▶ **Sensor**
 - ▶ Machine in which the IDS is running

Snort

- ▶ NIDS tool
- ▶ Anomaly-based inspection
 - ▶ Packet headers
- ▶ Misuse detection (pattern)
 - ▶ Packet content
- ▶ Open source multiplatform
- ▶ Rule files grouped into categories: **`/etc/snort/rules`**
- ▶ Configuration file: **`/etc/snort/snort.conf`**

Snort Components

- ▶ Packet decoder
 - ▶ Sniffs packets and decode them
- ▶ Preprocessor
 - ▶ Run before the detection engine is called, but after the packet has been decoded
 - ▶ The packet can be modified or analyzed in an out-of-band manner
- ▶ Detector engine
 - ▶ Pattern matching according to pre-configured rules
- ▶ Alert system
 - ▶ `/var/log/snort`
- ▶ Output modules
 - ▶ Plug-ins -> Logs and alarms

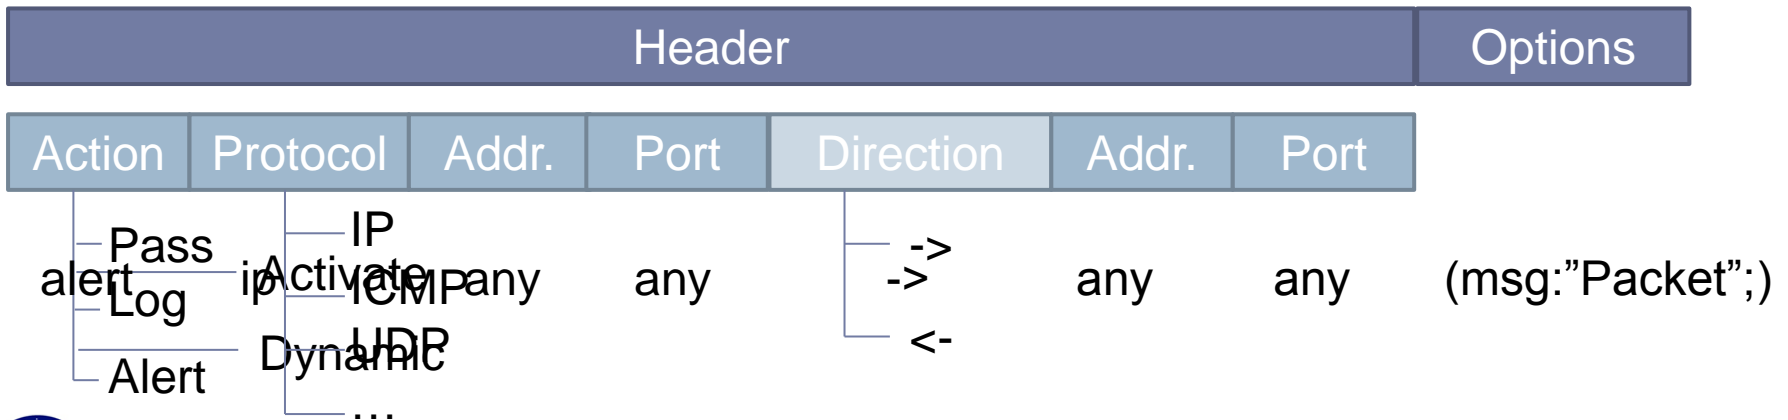

Snort commands

- ▶ Verification
 - ▶ `./snort -dvi eth0`
- ▶ Start and stop
 - ▶ `/etc/init.d/snortd start/stop`
 - ▶ `./snort -A full snort.conf`
- ▶ Help
 - ▶ `./snort -?`
- ▶ Alerts
 - ▶ `tail -f /var/log/snort/alerts`

Snort Rules

- ▶ Rules
 - ▶ Header
 - ▶ **Matching** conditions
 - ▶ Post-condition **actions**
 - ▶ Options
 - ▶ Alert message
 - ▶ Additional criterions

Snort Rule Options

▶ Options

- ▶ msg: message
- ▶ dsize: size of the payload
- ▶ content: content of the payload (most used)
- ▶ classtype: keyword is used to categorize a rule
- ▶ **sid: snort id**

▶ Example

- ▶ alert tcp any any -> 192.168.1.0/24 21 (content: "USER root"; nocase; msg: "FTP root user access attempt";)

Snort Rule Options

▶ **flags:**

- ▶ F - FIN (LSB in TCP Flags byte)
- ▶ S - SYN
- ▶ R - RST
- ▶ P - PSH
- ▶ A - ACK
- ▶ U - URG

▶ **Logic operators**

- ▶ * - ANY flag
- ▶ ! - NOT flag

Example

- ▶ alert any any -> 192.168.1.0/24 any (flags: SF; msg: "Possible SYN FIN scan");)

Preparing the environment

- ▶ DoS:
 - ▶ Small test:
 - ▶ **HttpFloodDoS.java**
 - ▶ Optionally:
 - ▶ <http://www.joedog.org/index/siege-home>
- ▶ Installing snort
 - ▶ Execute **cleanUbuntu.sh**
 - ▶ Execute **sudo -i**
 - ▶ Execute **installSnort.sh**
 - ▶ Configure:
 - ▶ Configuring snort Interface(s): eth2
 - ▶ Address range for the local network: 192.168.0.0/16

DoS Detection in Fakebook

▶ Task:

Provide the server with an Intrusion Detection System (IDS) so that the system's administrator will be alerted whenever a machine is performing a large number of connections to Fakebook.

▶ Documentation:

▶ http://www.snort.org/assets/166/snort_manual.pdf

▶ Tips

▶ Detection filters (3.7.10):

▶ You can use detection filters to specify a threshold that must be exceeded before a rule generates an event.

▶ Event filters (2.4.2)

▶ You can use event filters to reduce the number of logged events for noisy rules. This can be tuned to significantly reduce false alarms
